

Abstract

In a razor handle assembly, a first handle section includes a first body portion and a second handle section includes a second body portion, the first and second body portions generally being mirror images of one another. The first and second handle sections are coupled together and cooperate to form a closed end and a generally opposite open end. A head assembly is interposed between the first and second body sections at the open end and includes a retainer for releasably mounting a disposable razor cartridge to a razor handle. A core is positioned between the first and second body portions and has an end adjacent to the closed end formed by the first and second handle sections.
